LET'S BATTLE

World of Tanks Linux and Open Source Inside

Maksim Melnikau

I'm

- ▶ developer in Wargaming (Belarus, Minsk)
 - ▶ ~~Order of War~~
 - ▶ ~~Order of War: Challenge~~
 - ▶ World of Tanks
- ▶ Linux Mobile hobbyist
 - ▶ Openmoko
 - ▶ systemd
 - ▶ telepathy
 - ▶ Gentoo

World of Tanks

- ▶ mmorpg
- ▶ fps about tanks
- ▶ 15x15 pvp

World of Tanks Today

- ▶ 800k concurrent users in peak
- ▶ 8M messages per second
- ▶ 500 servers for game and web
- ▶ 60M game portal visits per month
- ▶ 5 PB (petabytes) for game installs and updates per month

Cheaters

- ▶ many players want to cheat
- ▶ cheaters make other players unhappy
- ▶ cheaters xenophobia

Scaleability

- ▶ better product — more users
- ▶ more users — more servers
- ▶ more servers — bigger synchronization problem

Single Datacenter Issues

- ▶ latency
- ▶ availability
- ▶ single point of failure

Big Data

- ▶ more users — more data
- ▶ more data — bigger disks
- ▶ suddenly, new storage solution required

Rapid Growth

- ▶ simple solution — faster time to market
- ▶ great success — simple solutions completely unusable
- ▶ rewriting everything on-the-fly
- ▶ business changes every day

Nobody Will Help You

- ▶ no time to educate people
- ▶ no time to wait 3rd party support
- ▶ no time to write good proper solutions

Full Control

- ▶ software
- ▶ data
- ▶ team
- ▶ hardware

Linux and Open Source Software

- ▶ ready to use components
- ▶ good documentation
- ▶ customize software when required
- ▶ hire people with required skills

World of Tanks Architecture

- ▶ game client — thin client, player
- ▶ server — world simulation
- ▶ cluster — thousands of process working as one server
- ▶ step-game world, with very small steps

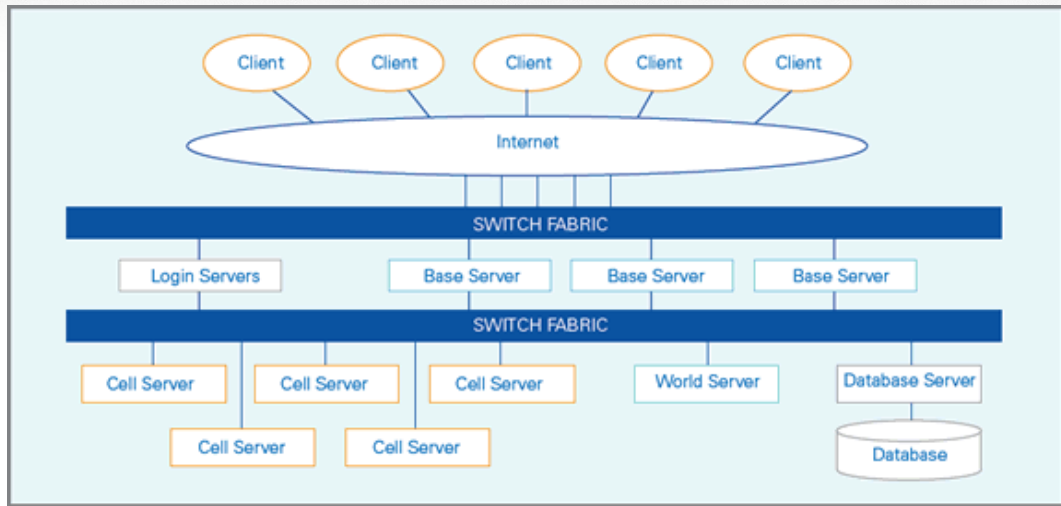

Development

- ▶ regular Python
- ▶ GC disabled
- ▶ some parts rewritten on C++
- ▶ message-based RPC
- ▶ UDP-based reliable internal protocol

Cluster

Multi Cluster

- ▶ scalability
- ▶ geo distributed
- ▶ availability
- ▶ independence

Production

1. 500 servers
2. 8k cpu cores
3. 32 TB RAM
4. Linux

MySQL

- ▶ database size: 300 GB
- ▶ 384 GB RAM
- ▶ Percona 5.5 (buffer pool warming — 1GBps)
- ▶ 40k selects, 1k inserts, 1k updates per second
- ▶ 24 HDD * 600 GB * 0.5 = 6 TB

Client

1. regular Python
2. HUD - ActionScript, Scaleform
3. 3D graphics - C++

Web Tasks

- ▶ registrations
- ▶ news
- ▶ docs
- ▶ media
- ▶ payment form
- ▶ receiving payments
- ▶ update distribution
- ▶ account management
- ▶ account profile
- ▶ statistics
- ▶ ratings
- ▶ ...

LNAMPMR

NGINX

Other

uWSGI

Keys to Success

- ▶ Linux on server
- ▶ relaying on Open Source
- ▶ fast and easy development
- ▶ having full control on everything
- ▶ don't afraid of different software stacks

Thank You. Questions
